

Video Enhancement Report: Back Lot/Rear Door Camera Still Frames (03:10–03:26)

CONFIDENTIAL • LAW ENFORCEMENT SENSITIVE

RESPONDING UNIT	REPORT DETAILS	CASE REFERENCE
Unit: _____	Report No.: _____	Case: _____
Badge: _____	Date: 05-14-2026 22:33	Classification: CONFIDENTIAL

CASE SYNOPSIS

Case: case_rookie_hardened — *The Diner Break-In* (Eugene, Oregon)

CLASSIFICATION DETAILS

Case Type	Cold Case Investigation
Priority Level	☐ Low ☐ Medium ☒ High ☐ Critical
Status	ACTIVE INVESTIGATION ☒ Active ☐ Under Review ☐ Closed
Lead Unit	Major Crimes Division

INCIDENT DETAILS

Incident Date	mai 14, 2026
Incident Time	10:33 p.m. -04:00
Location	[Location from case data]
Reporting Party	[Officer Name] - Badge #[#####]

SUBJECT INFORMATION

Name	[REDACTED]
Age	[##]
Sex/Race	[M/F] / [Race]
Last Known Address	[REDACTED]

INITIAL RESPONSE

First Responder: Officer [NAME], Badge #[#####]
Arrived: 10:33 p.m. -04:00
Scene Secured: 10:48 p.m. -04:00

INCIDENT REPORT

Issued on: 2026-05-14 22:33 (-04:00)

Video Enhancement Report: Back Lot/Rear Door Camera Still Frames (03:10–03:26)

CONFIDENTIAL • LAW ENFORCEMENT SENSITIVE

Incident date/time: 2026-05-11 03:18 (UTC–07:00)

Case opened: 2026-05-11 09:05 (UTC–07:00)

Requested analysis: VideoEnhancement of rear lot / rear door camera still frames (PDF export)

Chain of Custody

On 2026-05-11 09:05 (UTC–07:00), the laboratory received the item labeled “Back Lot/Rear Door Camera Still Frames” (Input Asset ID: `asset.back\_lot\_camera\_stills`) as a PDF export containing time-stamped still images covering the rear door area around the reported break-in time.

The item was logged under this case identifier and handled in a read-only workflow. All processing was performed on a verified working copy; the source PDF was preserved unchanged. No re-encoding back to the source format was performed; enhancements were produced as derivative images and documented as such.

No additional media (raw video container files, DVR originals, or camera-native frames) were provided with this submission. Reported timestamps were treated as provided and assessed for internal consistency within the exported frames.

Methodology

The analysis consisted of (1) extraction of frames from the submitted PDF, (2) targeted enhancement to improve visibility of subject outline and clothing features, and (3) comparative assessment against known/reference information available to the case (e.g., staff identity and general appearance descriptors). The scope was limited to the rear lot/rear door view represented by the exported stills.

Enhancement steps included: contrast normalization, localized exposure compensation, noise reduction, edge-preserving sharpening, and region-of-interest (ROI) enlargement around the path leading to the rear door and the door threshold area. Where motion blur was present, processing emphasized outline continuity rather than attempting speculative detail reconstruction.

Time stamps embedded in the still export were reviewed sequentially to determine whether a single subject could be tracked approaching the rear door at or near 03:18 (UTC–07:00). No attempt was made to infer identity from facial characteristics beyond what the imagery supported.

For comparison, the lab evaluated gross physical and clothing attributes visible in the enhanced frames (build, height relative to fixed scene features, hairstyle silhouette, and clothing contrast patterns). The comparison was described in terms of consistency rather than positive identification.

Findings

Across the incident window, the enhanced sequence shows a single human figure entering the camera’s field from the lot side and moving toward the rear service door. The subject’s movement is directionally consistent with approaching the door rather than passing through the lot.

At approximately 03:18 (UTC–07:00) (per the exported timestamp), the figure appears within the ROI adjacent to the rear door area. Enhancement improves the visibility of the subject’s upper-body outline and hair profile; however, the face remains indistinct due to distance, low light, and compression artifacts.

The subject’s build and stature (as estimated relative to door hardware height and nearby fixed reference points) are consistent with an average-height adult. The hairstyle silhouette presents as hair gathered back or pulled into a compact shape rather than loose, producing a distinct head outline that remains similar across consecutive frames.

Clothing characteristics visible after enhancement include a darker top with limited reflectivity and a lighter-toned lower area or contrast banding that intermittently appears with shifting exposure. These elements are consistent with

INCIDENT REPORT

common service/shift attire and do not, on their own, uniquely identify a person.

When compared to the suspect pool information available in the case file, the observable outline and styling features are most consistent with server Tessa Bly (Matched Suspect ID: `suspect.tessa\_bly`) and less consistent with individuals described as larger-framed or typically positioned at the front lot during the same period. This assessment is based on overall appearance consistency and the timeline association to the rear door area.

No clear tool in hand is reliably discernible in the provided stills. The imagery does not conclusively depict the moment of forced entry; it shows approach and proximity to the rear door area during the incident window.

There is no basis in the provided stills to assert a definitive facial identification. The lab therefore characterizes the identification outcome as consistent with rather than confirmed as Tessa Bly.

Conclusion

Video enhancement of the rear lot still-frame export indicates that a person approached and was present near the rear service door during the 03:18 incident window. The enhanced imagery shows a subject whose build, hairstyle silhouette, and clothing features are consistent with Tessa Bly, supporting investigative association between that individual and the rear door at the relevant time.

Limitations include the use of a PDF still export rather than camera-native footage, low-light conditions, and insufficient facial detail for positive identification. If available, the laboratory recommends obtaining the DVR-native video stream and camera metadata to improve time synchronization confidence and potentially increase identification reliability.
